Advanced Encryption Standard

Lecture slides by Lawrie Brown for "Cryptography and Network Security", 5/e, by William Stallings, Chapter 5 –"Advanced Encryption Standard".

Chapter 5 – Advanced Encryption Standard

"It seems very simple."

"It is very simple. But if you don't know what the key is it's virtually indecipherable."

—Talking to Strange Men, Ruth Rendell

Origins

- clearly a replacement for DES was needed
 - have theoretical attacks that can break it
 - have demonstrated exhaustive key search attacks
- can use Triple-DES but slow, has small blocks
- U.S. NIST issued call for ciphers in 1997
- 15 candidates accepted in Jun 98
- 5 were shortlisted in Aug-99
- Rijndael was selected as the AES in Oct-2000
- issued as FIPS PUB 197 standard in Nov-2001

AES Requirements

- private key symmetric block cipher
- 128-bit data, 128/192/256-bit keys
- stronger & faster than Triple-DES
- active life of 20-30 years (+ archival use)
- provide full specification & design details
- both C & Java implementations
- NIST have released all submissions & unclassified analyses

The AES Cipher - Rijndael

- designed by Rijmen-Daemen in Belgium
- has 128/192/256 bit keys, 128 bit data
- an **iterative** rather than **feistel** cipher
 - processes data as block of 4 columns of 4 bytes
 - operates on entire data block in every round
- designed to be:
 - resistant against known attacks
 - speed and code compactness on many CPUs
 - design simplicity

AES Structure

- \geq data block of 4 columns of 4 bytes is state
- ➢ key is expanded to array of words
- ➢ has 9/11/13 rounds in which state undergoes:
 - byte substitution (1 S-box used on every byte)
 - shift rows (permute bytes between groups/columns)
 - mix columns (subs using matrix multiply of groups)
 - add round key (XOR state with key material)
 - view as alternating XOR key & scramble data bytes
- initial XOR key material & incomplete last round
 with fast XOR & table lookup implementation

AES Structure

Some Comments on AES

- 1. an **iterative** rather than **feistel** cipher
- key expanded into array of 32-bit words
 four words form round key in each round
- 3. 4 different stages are used as shown
- 4. has a simple structure
- 5. only AddRoundKey uses key
- 6. AddRoundKey a form of Vernam cipher
- 7. each stage is easily reversible
- 8. decryption uses keys in reverse order
- 9. decryption does recover plaintext
- 10. final round has only 3 stages

Substitute Bytes

- a simple substitution of each byte
- uses one table of 16x16 bytes containing a permutation of all 256 8-bit values
- each byte of state is replaced by byte indexed by row (left 4-bits) & column (right 4-bits)
 - eg. byte {95} is replaced by byte in row 9 column 5
 - which has value {2A}
- S-box constructed using defined transformation of values in GF(2⁸)
- designed to be resistant to all known attacks

Substitute Bytes

Substitute Bytes Example

EA	04	65	85		
83	45	5D	96	_	ł
5C	33	98	B 0	_	4
F0	2D	AD	C5		8

87	F2	4D	97
EC	6E	4C	90
4A	C3	46	E7
8C	D8	95	A6

Shift Rows

- a circular byte shift in each each
 - 1st row is unchanged
 - 2nd row does 1 byte circular shift to left
 - 3rd row does 2 byte circular shift to left
 - 4th row does 3 byte circular shift to left
- decrypt inverts using shifts to right
- since state is processed by columns, this step permutes bytes between the columns

Shift Rows

s _{0,0}	s _{0,1}	s _{0,2}	s _{0,3}
s _{1,1}	s _{1,2}	s _{1,3}	s _{1,0}
\$ _{2,2}	\$ _{2,3}	\$ _{2,0}	\$ _{2,1}
\$ _{3,3}	s _{3,0}	s _{3,1}	s _{3,2}

87	F2	4D	97		
EC	6E	4C	90	_	
4A	C3	46	E7	-	
8C	D8	95	A6		

87	F2	4D	97
6E	4C	90	EC
46	E7	4A	C3
A6	8C	D8	95

Mix Columns

- each column is processed separately
- each byte is replaced by a value dependent on all 4 bytes in the column
- effectively a matrix multiplication in $GF(2^8)$ using prime poly m(x) =x⁸+x⁴+x³+x+1

$$\begin{bmatrix} 02 & 03 & 01 & 01 \\ 01 & 02 & 03 & 01 \\ 01 & 01 & 02 & 03 \\ 03 & 01 & 01 & 02 \end{bmatrix} \begin{bmatrix} s_{0,0} & s_{0,1} & s_{0,2} & s_{0,3} \\ s_{1,0} & s_{1,1} & s_{1,2} & s_{1,3} \\ s_{2,0} & s_{2,1} & s_{2,2} & s_{2,3} \\ s_{3,0} & s_{3,1} & s_{3,2} & s_{3,3} \end{bmatrix} = \begin{bmatrix} s_{0,0} & s_{0,1} & s_{0,2} & s_{0,3} \\ s_{1,0} & s_{1,1} & s_{1,2} & s_{1,3} \\ s_{2,0} & s_{2,1} & s_{2,2} & s_{2,3} \\ s_{3,0} & s_{3,1} & s_{3,2} & s_{3,3} \end{bmatrix}$$

Mix Columns

Mix Columns Example

87	F2	4D	97		47	40	A3	4C
6E	4C	90	EC	_	37	D4	70	9F
46	E7	4A	C3		94	E4	3A	42
A6	8C	D8	95		ED	A5	A6	BC

({02} • {87})	⊕ ({03} • {6E })	⊕ {46}	⊕ {A6}	= {47}
{87}	⊕ ({02} • {6E })	\oplus ({03} • {46})	⊕ {A6}	= {37}
{87}	⊕ {6E }	\oplus ({02} • {46})	⊕({03} • { A6})	= {94}
({03} • {87})	⊕ {6E }	⊕ {46}	⊕ ({02} • { A6})	= {ED}

AES Arithmetic

- uses arithmetic in the finite field $GF(2^8)$
- with irreducible polynomial $m(x) = x^8 + x^4 + x^3 + x + 1$ which is (100011011) or {11b}

```
e.g.
{02} • {87} mod {11b} = (1 0000 1110) mod {11b}
= (1 0000 1110) xor (1 0001 1011) = (0001 0101)
```

Mix Columns

- can express each col as 4 equations
 - to derive each new byte in col
- decryption requires use of inverse matrix
 - with larger coefficients, hence a little harder
- have an alternate characterisation
 - each column a 4-term polynomial
 - with coefficients in GF(2⁸)
 - and polynomials multiplied modulo (x^4+1)

Add Round Key

- XOR state with 128-bits of the round key
- again processed by column
- inverse for decryption identical
 - since XOR own inverse, with reversed keys
- designed to be as simple as possible
 - a form of Vernam cipher on expanded key
 - requires other stages for complexity / security

Add Round Key

 \oplus

s _{0,0}	s _{0,1}	s _{0,2}	s _{0,3}
s _{1,0}	s _{1,1}	s _{1,2}	s _{1,3}
S _{2,0}	s _{2.1}	\$ _{2,2}	\$ _{2,3}
	-	_,_	2,2

	Wi	W _{i+1}	W _{i+2}	W _{i+3}	=
--	----	------------------	------------------	------------------	---

s' _{0,0}	s' _{0,1}	s' _{0,2}	s' _{0,3}
s' _{1,0}	s' _{1,1}	s' _{1,2}	s' _{1,3}
s' _{2,0}	s' _{2,1}	s' _{2,2}	s' _{2,3}
s' _{3,0}	s' _{3,1}	s' _{3,2}	s' _{3,3}

AES Round

AES Key Expansion

- takes 128-bit (16-byte) key and expands into array of 44/52/60 32-bit words
- start by copying key into first 4 words
- then loop creating words that depend on values in previous & 4 places back
 - in 3 of 4 cases just XOR these together
 - 1st word in 4 has rotate + S-box + XOR round constant on previous, before XOR 4th back

AES Key Expansion

Key Expansion Rationale

- designed to resist known attacks
- design criteria included
 - knowing part key insufficient to find many more
 - fast on wide range of CPU's
 - use round constants to break symmetry
 - diffuse key bits into round keys
 - enough non-linearity to hinder analysis
 - simplicity of description

AES Example Avalanche

AES Decryption

- AES decryption is not identical to encryption since steps done in reverse
- but can define an equivalent inverse cipher with steps as for encryption
 - but using inverses of each step
 - with a different key schedule
- works since result is unchanged when
 - swap byte substitution & shift rows
 - swap mix columns & add (tweaked) round key

AES Decryption

Implementation Aspects

- can efficiently implement on 8-bit CPU
 - byte substitution works on bytes using a table of 256 entries
 - shift rows is simple byte shift
 - add round key works on byte XOR's
 - mix columns requires matrix multiply in GF(2⁸) which works on byte values, can be simplified to use table lookups & byte XOR's

Implementation Aspects

- can efficiently implement on 32-bit CPU
 - redefine steps to use 32-bit words
 - can precompute 4 tables of 256-words
 - then each column in each round can be computed using 4 table lookups + 4 XORs
- designers believe this very efficient implementation was a key factor in its selection as the AES cipher

Summary

- have considered:
 - the AES selection process
 - the details of Rijndael the AES cipher
 - looked at the steps in each round
 - the key expansion
 - implementation aspects
